# Blood Clotting Enzymology

Edited by **Walter H. Seegers**

*Department of Physiology and Pharmacology  
School of Medicine  
Wayne State University, Detroit, Michigan*

This is an introduction to the general field of blood clotting enzymology. The application of basic principles in clinical medicine is delineated in terms of platelet function, hemorrhagic diseases, thrombosis and physiological integration. The true course of the coagulation of the blood has been delineated, from its inception through clot retraction, and the neutralization of enzyme activity. This is a conservative treatment of the subject with a refreshing concentration on available facts. This realistic and critical analysis places the subject within the framework of modern concepts in enzymology, and the physiology of hemostasis.
